Implement the "**Student**" class that is derived from the "**BRACu**" class so that the following output is generated.

```
class BRACu:
    studentInfo={}
    studentNo = 0
    def __init__(self,name,id,department):
        self.name = name
        self.id = id
        self.department = department
    def __str__(self):
        return
"Name:{}\nID:{}\nDepartment:{}".format(self.name,se
lf.id,self.department)

#Write your code here

print("Number of students:",BRACu.studentNo)
print("Department wise Student:",BRACu.studentInfo)
print("=================================")
s1 = Student("Sakib",20301098,"CSE",50)
print("------Details of the Student------")
print(s1)
print("=================================")
print("Number of Students:",BRACu.studentNo)
print("Department wise Student:",BRACu.studentInfo)
print("=================================")
s2 = Student("Tamim",22321155)
print("------Details of the Student------")
print(s2)
print("=================================")
print("Number of Students:",BRACu.studentNo)
print("Department wise Student:",BRACu.studentInfo)
print("=================================")
s3=Student.enroll_Student("Mash-21201150-BBA-100")
print("------Details of the Student------")
print(s3)
print("=================================")
print("Number of Students:",BRACu.studentNo)
```

Output

```
Number of students: 0
Department wise Student: {}
=================================
------Details of the Student------
Name:Sakib
ID:20301098
Department:CSE
Scholarship:50%
=================================
Number of Students: 1
Department wise Student: {'CSE':
['Sakib']}
=================================
------Details of the Student------
Name:Tamim
ID:22321155
Department:CSE
Scholarship:0%
=================================
Number of Students: 2
Department wise Student: {'CSE':
['Sakib', 'Tamim']}
=================================
------Details of the Student------
Name:Mash
ID:21201150
Department:BBA
Scholarship:100%
=================================
Number of Students: 3
Department wise Student: {'CSE':
['Sakib', 'Tamim'], 'BBA': ['Mash']}
```

`print("Department wise Student:",BRACu.studentInfo)`
