

Implement the *Group* Class that is derived from **Competition** class so that the following output is generated. [The group name can be of any number of words.]

```
class Competition:
    info={}
    groupNo = 0

    def __init__(self,group_name,member):
        self.group_name = group_name
        self.total_member = member
        self.total_fee = 0

    def __str__(self):
        return "Groupname: {}\nMembers: {}".format(self.group_name,self.total_member)
```

#Write your code here

```
print("Number of groups:",Competition.groupNo)
print("Group Database:",Group.info)
print("#####")
g1 = Group("Abstract Connoisseurs Group", 6, 3)
g1.winningCompetitions("ACM-ICPC, Technovation Challenge,
HackerEarth")
print("-----Details of the group-----")
print(g1)
print("#####")
g2 = Group("Boolean Autocrats", 3)
g2.winningCompetitions()
print("-----Details of the group-----")
print(g2)
print("#####")
g3 = Group.createGroup("Hex Clan",6, 2)
g3.winningCompetitions("TechGig, Hackathon")
print("-----Details of the group-----")
print(g3)
print("#####")
print("Number of groups:",Competition.groupNo)
print("group info:",Competition.info)
print("#####")
g1.competeAgainst(g2)
g1.competeAgainst(g3)
g3.competeAgainst(g2)
```

Output

```
Number of groups: 0
Group Database: {}
#####
-----Details of the group-----
